٥.

1. In view of the papers filed 1/9/2006, the inventorship in this nonprovisional application has been changed by the deletion of Mr. Osamu Endou.

The application will be forwarded to the Office of Initial Patent Examination (OIPE) for issuance of a corrected filing receipt, and correction of Office records to reflect the inventorship as corrected.

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(a) the invention was known or used by others in this country, or patented or described in a printed publication in this or a foreign country, before the invention thereof by the applicant for a patent.

2. Claims 1-12,18-29 are rejected under 35 U.S.C. 102(a) as being anticipated by Umezawa et al. (JP# 2002-182470).

Umezawa teach (translation attached) a developing device comprising a developing roller 11, a toner supply roller 12, a seal member 15, and a toner regulating roller 14 arranged in contact with the developing roller to regulate the toner held on the developing roller. A plurality of developing devices 5Bk, 5C, 5Y, 5M can be pivoted into and out of engagement with a photosensitive belt 1 depending on whether a developing operation is to be performed. When a particular developing device is pivoted into engagement with the photosensitive belt to start a developing operation the developing roller will rotate in a counterclockwise direction to apply toner to the belt while the regulating roller 14 is locked in

Art Unit: 2852

position. When it is pivoted away during a non-image forming operation, the developing roller rotates in a clockwise manner while the regulating roller freely rotates therewith for a predetermined time period. During a non-image forming operation, the developing roller will not have any toner adhered thereto. Since the developing roller is larger than the regulating roller, the rotation number of the developing roller will be smaller than the regulating roller. The developing roller/regulating roller rotation can also occur at the start of powering up the printer (setup) or if the time between image formations is longer than a predetermined time period (see paragraphs 46-50). It is contemplated to perform a reverse rotation subsequently followed by a forward rotation as a modification of the rotation of developing roller (see paragraphs 55-56).

3. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Endoh et al. '674, Yoshizawa, Endoh et al. '506, Aoki et al., JP# 2002-311707, lio (JP '380), and lio (JP'908) teach various developing device having roller regulating means.

4. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Robert Beatty whose telephone number is (571) 272-2130. The examiner can normally be reached on M-F from 9 to 6.

Application/Control Number: 10/762,254

Art Unit: 2852

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Arthur Grimley, can be reached on (571) 272-2136. The fax phone number for the organization where this application or proceeding is assigned is (703) 872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
